

SELENIUM

INTRODUCTION:

Automation tools like Selenium are used to beat the tedious challenges of manual testing.

Some of the main advantages for using Selenium are as follows:

Selenium is:

- Is an open-source tool that can automate any web browser and is available for free.
- Works with with any operating system (windows. linux, mac).
- Supports multiple environments and multiple programming languages (Java, C#, ruby, python, perl and php).
- Directly runs scripts for any web browser to automate the web application and test it.
Is fast and easy to use even with large sets of data, and has a guaranteed accuracy.

Objective:

Create class "Webdriverbasic" with a webdriver script that

1. fetch Google's homepage
2. verify its title
3. print out the result of the comparison
4. close it before ending the entire program.

WebDriver Code:

Below is the actual WebDriver code for the logic presented by the scenario above

```
package seleniumsessions;
```

```
// Import appropriate packages
```

```
import org.openqa.selenium.*;
```

```
import org.openqa.selenium.firefox.*;
```

```
import org.openqa.selenium.WebDriver;
```

```
import org.openqa.selenium.chrome.*;
```

```
//create class
```

```
public class Webdriverbasic {
```

```
    //Main method
```

```
    public static void main(String[] args) {
```

```
        //Chrome Browser
```

```
        System.setProperty("webdriver.chromedriver.exe.driver", "C:\\chromedriver.exe");
```

```
//declaration and instantiation of object variables
```

```
WebDriver driver=new ChromeDriver();//using chrome browser
```

```
driver.get("https://www.google.com");
```

```
//Get the actual value of the title and print
```

```
String Title = driver.getTitle();
```

```
System.out.println(Title);
```

```
//Compare the actual value of the title and print if it is correct or incorrect
```

```
if(Title.equals("Google")) {
```

```
    System.out.println("correct title");
```

```
}
```

```
else {
```

```
    System.out.println("Incorrect title");
```

```
}
```

```
//Get the current url after launching chrome browser
```

```
System.out.println(driver.getCurrentUrl());
```

```
//getPageSource method
```

```
System.out.println(driver.getPageSource());
```

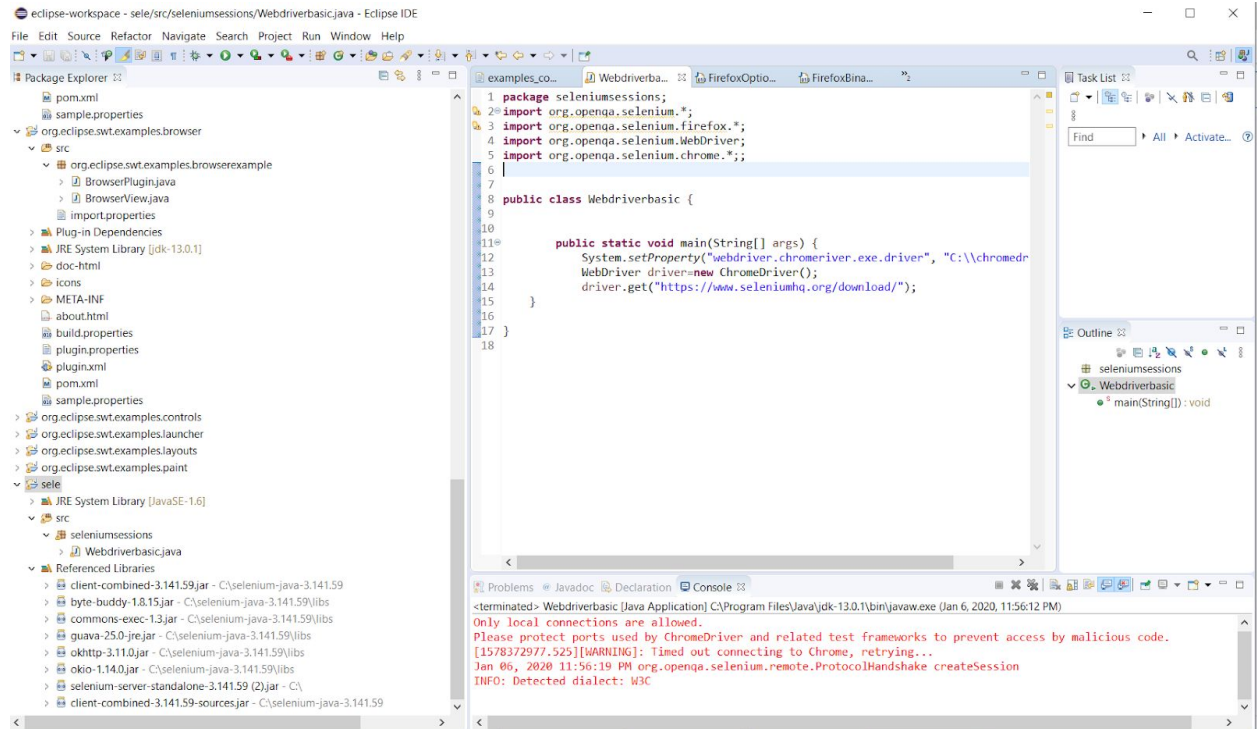

```
//Quit the browser  
  
driver.quit();  
  
}  
  
}
```

Create Webdriverbasic class and mporting Packages

The following two packages needs to be imported in order to get started:

1. **org.openqa.selenium.***- contains the WebDriver class needed to instantiate a new browser loaded with a specific driver
2. **org.openqa.selenium.chrome** - contains the chromeDriver class needed to instantiate a chromespecific driver onto the browser instantiated by the WebDriver class
3. **org.openqa.selenium.WebDriver** - contains the Wedriver class along with its methods to be invoked by the Webdriverbasic class.

Create class called "Webdriverbasic" with the main method. Ensure that the path for the chromedriver property is set correctly. Click on run - chrome browser should open and the browser should load the google.com webpage as follows.

Get the actual page title:

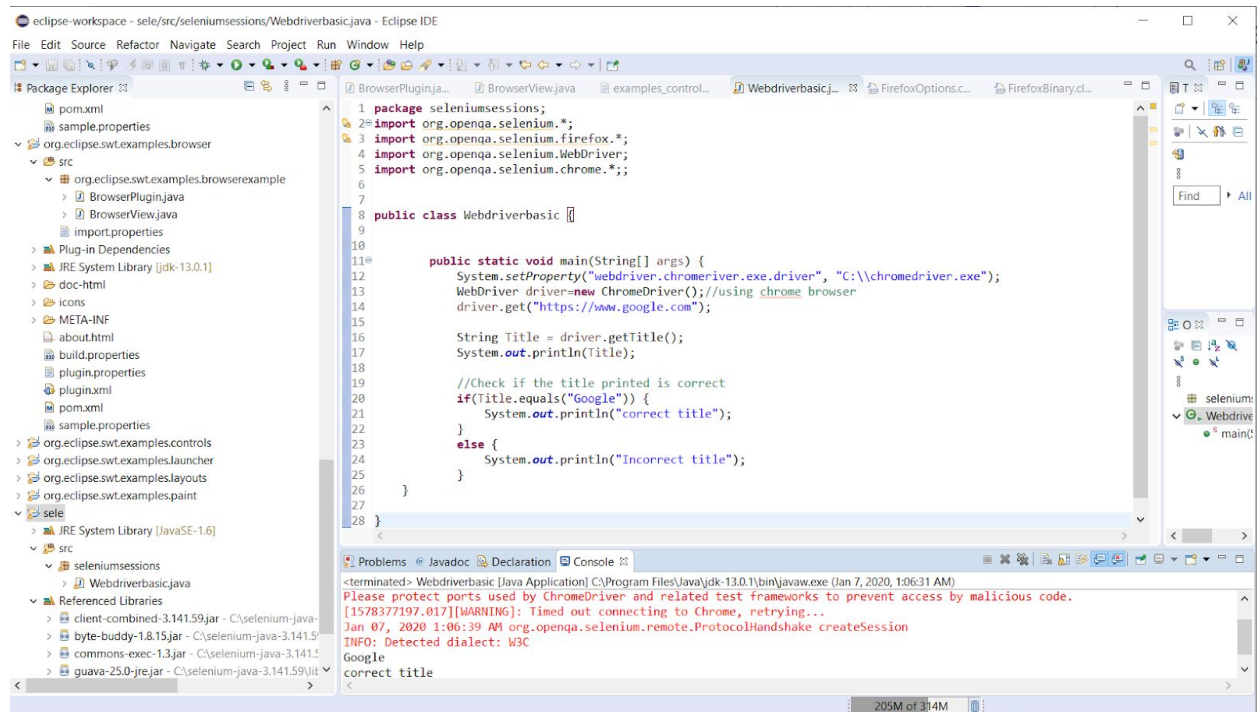

The WebDriver class has the **getTitle()** method that is always used to obtain the page title of the currently loaded page.

The output displays the value "Google". A chrome browser should open and the google.com page will be loaded automatically

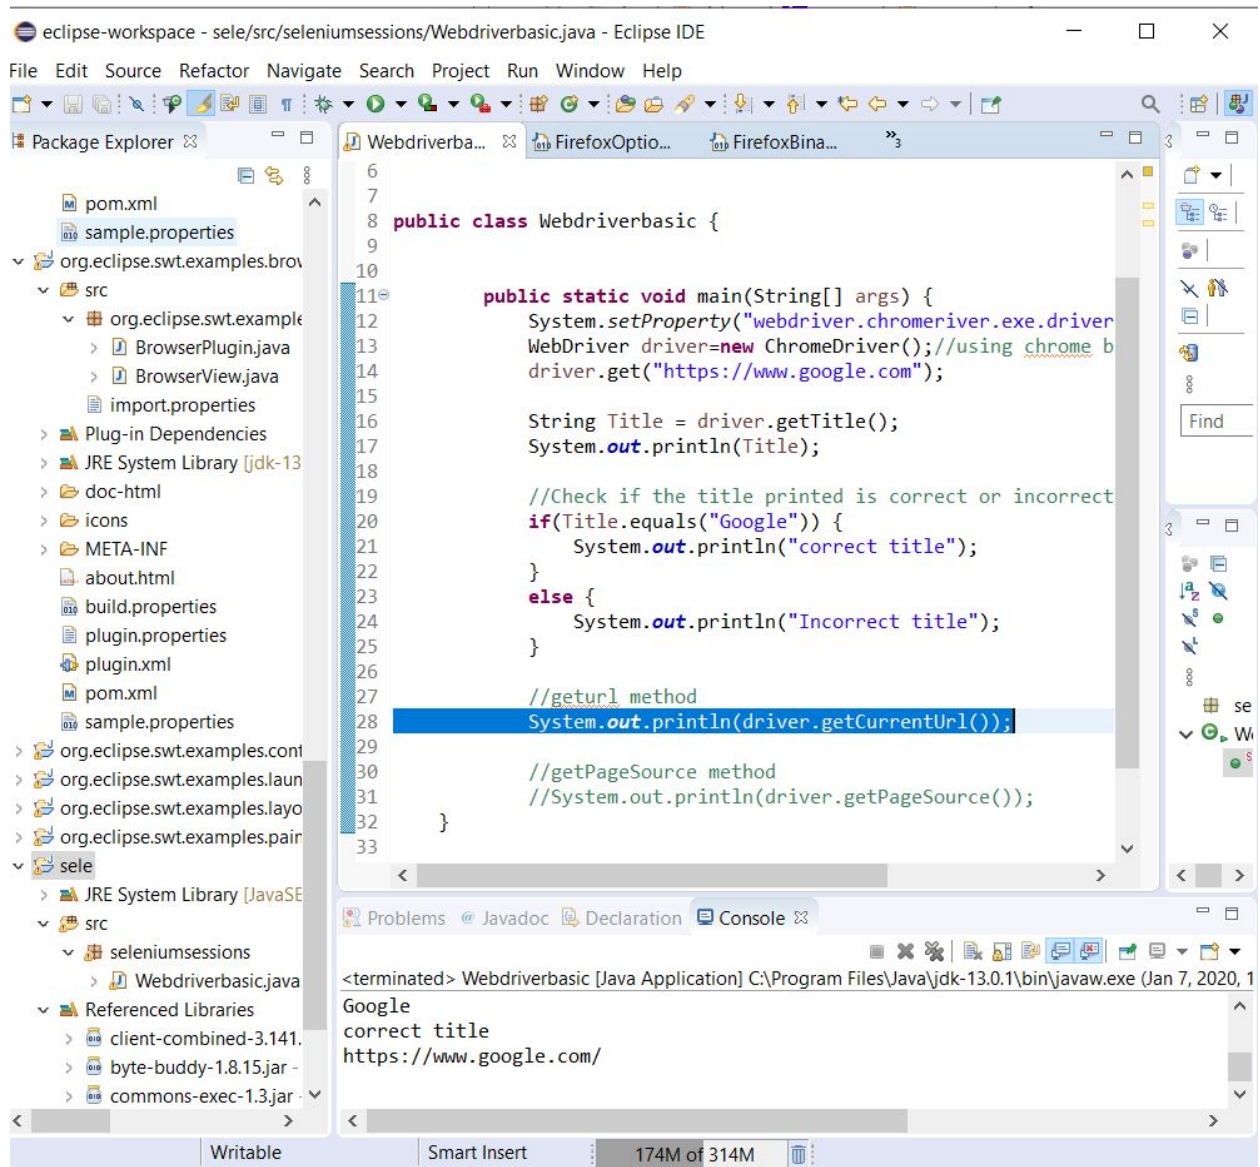

Compare the actual title of the page and print “Correct title” else print “Incorrect title”

Get the current url:

The WebDriver class has the **getCurrentUrl()** method that is always used to obtain the page url of the currently loaded page.

The getUrl method, should print "www.google.com" in the output and open the chrome browser and loads www.google.com webpage.

The screenshot shows the Eclipse IDE interface. The Package Explorer on the left displays a project structure with a package named `org.eclipse.swt.examples.selenium` containing a `Webdriverbasic.java` file. The main editor window shows the source code of `Webdriverbasic.java`. The code defines a `public class Webdriverbasic` with a `main` method. The `main` method sets the system property for the ChromeDriver, creates a `ChromeDriver` instance, and navigates to `https://www.google.com`. It then prints the page title and the current URL. The console at the bottom shows the output of the program, which is:

```
<terminated> Webdriverbasic [Java Application] C:\Program Files\Java\jdk-13.0.1\bin\javaw.exe (Jan 7, 2020, 1
Google
correct title
https://www.google.com/
```

Get the actual page source:

The WebDriver class has the **getPageSource()** method that is always used to obtain the page source of the currently loaded page.

getPageSource() method will print the page source information and open the chrome browser and load google webpage.

The screenshot shows the Eclipse IDE interface. The Package Explorer on the left displays the project structure, including the 'src' folder and various Java files. The main editor window shows the 'WebdriverBasic.java' file with the following code:

```
7 public class WebdriverBasic {
8
9
10
11     public static void main(String[] args) {
12         System.setProperty("webdriver.chrome.driver", "C:\\chromedriver.exe");
13         WebDriver driver=new ChromeDriver();//using chrome browser
14         driver.get("https://www.google.com");
15
16         String Title = driver.getTitle();
17         System.out.println(Title);
18
19         //Check if the title printed is correct or incorrect
20         if(Title.equals("Google")) {
21             System.out.println("correct title");
22         }
23         else {
24             System.out.println("Incorrect title");
25         }
26
27         //geturl method
28         System.out.println(driver.getCurrentUrl());
29
30         //getPageSource method
31         System.out.println(driver.getPageSource());
32     }
33 }
34
```

The console output at the bottom shows the execution of the program, including the title 'Google' and the page source information.

```
<terminated> WebdriverBasic [Java Application] C:\Program Files\Java\jdk-13.0.1\bin\javaw.exe (Jan 7, 2020, 1:16:59 AM)
var v=function(a){v[" "](a);return a};v[" "]=1;var ca=-1!=r.indexOf("Opera"),w=-1!=r.indexOf("Trident")?H=!I}var ia=H,ja=function(){if(!k.addEventListener||!Object.defineProperty)return!1;var a=!1,b=(d=null)}else"mouseover"==c?d=a.fromElement:"mouseout"==c&&(d=a.toElement);this.relatedTarget=d;a.shiftKey;this.metaKey=a.metaKey;this.pointerId=a.pointerId|0;this.pointerType="string"===typeo;b.concat(),a=0;a<b.length;a++){var f=b[a];f&&f.capture==c&&f.h&&(f=xa(f,e),d=d&&1!=f)}return d;d=documentElement.clientWidth?4:1;var l,n=["aft","hct","prt","ppt","sct"];function p(a){return function D(){if(!y&&x==v){var a="&ima="+v+"&imad="+w;google.timers.load.e.imn&&(a+="&imn="+google.window.performance.navigation)&&2==g.type&&(b+="&bb=1");"gsasrt"in d&&(g=p("qsd"),0<g&&(b+="&qsd=function G(a){var b="string"!=typeof a.src||!a.src,c=!a.getAttribute("data-bsrc"),d=a.getAttribu

Quit the Browser:

Use the driver.quit() to open and quit the browser
